Envision Overview

Envision® is widely used for Business Process Management, Requirements Management, Enterprise Architecture, Strategic Planning, Risk Management, Systems architecture, analysis and design. Organizations & independent consultants choose Envision because of its unique interface, adaptability, ability to leverage information, its powerful tools for importing, reporting & analyzing data, and its robust multi-user support.

Intuitive User Interface

Tired of shuffling endless documents, diagrams, graphs and spreadsheets looking for the right information? Envision makes it easy to create your own intuitive view of your enterprise. Using Envision is easy because of its customizable graphical user interface and smart Copy/Paste & Drag/Drop capabilities for rapidly entering existing data.

Adaptable

Create your own custom models and link them with relevant organizational models. Modifications can be made at any point in a project lifecycle enabling you to dynamically adapt to changing needs or insights.

Leverage Information

Envision's underlying data repository leverages and manages all enterprise project information. Envision eliminates inconsistent and confusing enterprise information. Users can view numerous enterprise layers and see a complete, up-to-date, picture of the business.

Powerful Reporting Options

Business goals/objectives can be traced to existing business practices and procedures. Envision shows complex business systems in a graphical, easy to understand manner. Custom import/export filters extract associated data for use within the organization and can also feed existing organizational data into the models. Users can easily print or export to outside applications. Envision includes several unique internal tools for analyzing/reporting on the models:

- Matrix Analysis - create and view custom Item/Attribute, Connections or Relational Matrices
- Diagram Picker - “See the forest for the trees!” view diagram thumbnails in their appropriate hierarchy
- Data Browser - access all repository diagrams/items from a structured repository tree

True Multi-user Support

Envision supports a group work environment, yet maintains the security and integrity of the repository information at all times. No merging of files or manually comparing data is required. Envision handles it all seamlessly.

Dynamic Linking

Encapsulate all your development and office productivity tools under a common interface. Users can double click on any object in an Envision model and invoke an outside application even feeding data to it if desired.

Enterprise Web Service

A new Envision Web Services feature will provide a backdoor two way communication capability with the Envision Project Repository. Data feeds from other authorized Windows sources and services can be setup to automatically insert data into or retrieve data from an Envision Project. This will enable Envision Projects to serve as “real-time” dashboards for an enterprise.

Envision® is the tool of choice for professionals and consultants.
